

Experiment 1.2

Student Name: Arpeet Kandhol UID: 23BAI70396

Branch: BE-AIT-CSE **Section/Group:** 23AIT KRG G-1

Semester: 5th Date of Performance: 30 July 2025

Subject Name: ADBMS Subject Code: 23CSP-333

MEDIUM - LEVEL

1. **Problem Title:** Organizational Hierarchy Explorer

2. **Problem Description:** You are a Database Engineer at TalentTree Inc., an enterprise HR analytics platform that stores employee data, including their reporting relationships. The company maintains a centralized Employee relation that holds:

Each employee's ID, name, department, and manager ID (who is also an employee in the same table). Your task is to generate a report that maps employees to their respective managers, showing:

- a. The employee's name and department
- b. Their manager's name and department (if applicable)
- c. This will help the HR department visualize the internal reporting hierarchy.

3. **SQL Commands:**

a. Create the database and use it:

```
create database AIT_1A;
use AIT_1A;
```

b. Create tables Employee and adding Foreign key:

c. Insert the values in the tables:

```
I SERT I TO Employee (EmpID, Emp ame, Department, ManagerID)
VALUES
(1, 'Alice', ' R', ULL),
(2, 'Bob', 'Finance', 1),
(3, 'Charlie', 'IT', 1),
(4, 'David', 'Finance', 2),
(5, 'Eve', 'IT', 3),
(6, 'Frank', ' R', 1);
```

d. Selecting the Employee with their respective managers:

```
SELECT E1.Emp□ame [Employee ame], E2.Emp□ame [Manager ame],
E1.Department [Emp_dept],
E1.Department [Manager_dept]
from Employee as E1
left outer join Employee as E2 on E1.ManagerID = E2.EmpID;
```

4. Output:

	Name Own		ner Type		Creat	ted_datetir	ne						
1	Employee dbo userta		rtable	2025-07-30 10:17:25.060									
	Column_name		Туре	Compu	omputed Leng		Prec	rec Scale Nullable		TrimTrailingBlanks FixedLenNullInSource		Collation	
1	EmpID	i	int	no		4	10	0	no	(n/a)	(n/a)	NULL	
2	EmpName	,	varchar	no		50			no	no	no	SQL_Latin1_General_CP1_CI_AS	
3	Department	1	varchar	no		50			no	no	no	SQL_Latin1_General_CP1_CI_AS	
4	ManagerID	i	int	no		4	10	0	yes	(n/a)	(n/a)	NULL	

Figure 1 Employee Table Description

	Employee Name	Manager Name	Emp_dept	Manager_dept
1	Alice	NULL	HR	HR
2	Bob	Alice	Finance	Finance
3	Charlie	Alice	IT	IT
4	David	Bob	Finance	Finance
5	Eve	Charlie	IT	IT
6	Frank	Alice	HR	HR

Figure 2 Output of the Select Query

5. Learning Outcome:

- a. I learnt how to link and add constraints like primary key after the table creation.
- b. I learnt about different types of joints.
- c. I learnt how to use LEFT OUTER JOIN to retrieve combined data from related tables.

HARD - LEVEL

- 1. **Problem Title:** Financial Forecast Matching with Fallback Strategy
- 2. **Problem Description:** You are a Data Engineer at FinSight Corp, a company that models Net Present Value (NPV) projections for investment decisions. Your system maintains two key datasets:

Year_tbl: Actual recorded NPV's of various financial instruments over different years:

ID: Unique Financial instrument identifier.

YEAR: Year of record

NPV: Net Present Value in that year

Queries_tbl: A list of instrument-year pairs for which stakeholders are requesting NPV values:

ID: Financial instrument identifier

YEAR: Year of interest.

Find the NPV of each query from the Queries table. Return the output order by ID and Year in the sorted form. However, not all ID-YEAR combinations in the Queries table are present in the Year_tbl. If an NPV is missing for a requested combination, assume it to be 0 to maintain a consistent financial report.

3. **SQL Commands:**

a. Create the tables.

```
CREATE TABLE Year_tbl (
    ID I T,
    YEAR I T,
    flV I T
);

-- Create Queries table (requested values)

CREATE TABLE Queries (
    ID I T,
    YEAR I T
);
```

b. Insert the values.

```
I SERT I TO Year_tbl (ID, YEAR, flV) VALUES
(1, 2018, 100),
(7, 2020, 30),
(13, 2019, 40),
(1, 2019, 113),
(2, 2008, 121),
(3, 2009, 12),
(11, 2020, 99),
(7, 2019, 0);
I SERT I TO Queries (ID, YEAR) VALUES
(1, 2019),
(2, 2008),
(3, 2009),
(7, 2018),
(7, 2019),
```

```
(7, 2020),
(13, 2019);
```

c. Use a subquery to count the number of courses under each department.

```
select q.id, q.year, Isnull(y. flV, 0) [ flV]
from Queries as q
left outer join Year_tbl as y on q.id = y.id and q.YEAR = y.YEAR
order by q.id;
```

4. Output:

	Name	Owne	r Typ	oe e	Crea	ated_datet	ime					
1	Year_tbl	dbo	use	er table	2025-07-30 10:28:07.473

Figure 3 Select Query

5. Learning Outcomes:

- a. I learned how to perform left join and understand the table.
- b. I learned some of the build functions of the Microsoft SQL server.
- c. I learned about aliases in the SQL queries.
